The Excel window

Sheets tabs

Working with rows & columns

- Selecting one column / three contiguous columns / column B + D + G.
- Selecting one row / 10 contiguous rows / rows 6 + 16 + 26 +36.
- Adjusting column width and row height with the mouse / by number.
- Hiding rows / columns.
- Inserting / deleting rows / columns.
- Autofit on columns and rows.
- Move quickly with Ctrl + arrow.
- Selecting a set of rows / columns: Click on the first row / column and then press and maintain the Shift key down before clicking on the last row /column of the desired set. This will select every row / column between the first and the last one.
- Selecting random rows / columns: Click on the first one then press Ctrl down and click on any other row / column to add them to the selection.

Working with cells

- Insert / edit content in a cell / via the formula bar.
- Insert a value in a range: select a block of cells, type any value then press Ctrl + Enter to automatically duplicate that value in all selected cells.
- Selecting a set of cells: Click on the first cell and then press Shift before clicking on the last cell of the desired range. All cells between the first and last one will be selected (contiguous selection).
- Selecting random cells: Click on any cell then press down on Ctrl, click on any subsequent cell to add them to the current selection.
- Go to a certain cell: to move the cursor to cell PP320, click in the name bar and type the PP320 in it. Excel will then take you to that cell. You can also go to Home > Find & Select > Go To.

Formatting cells

- Type today's date in B5, The text «Hello» in C5 and the number 100 in D5. Notice the automatic alignment in each cell. (right aligned for numbers, left aligned for texts).
- Change the font family, size and color. Modify the background color and the alignment.
- Add borders to a range of cells
- Center titles using 'Merge and Center'.
- Center text over a range of cells : click on the alignment settings button at the right bottom corner of the alignment group of the Home ribbon.
- Use the format painter to apply a certain style to different cells (double click for applying more than once)
- Use the automatic styles of cells (Styles group of the home ribbon).
- Use Page layout > Themes group to change the theme of the workbook.

Selecting cells

- Selecting a block of contiguous cells: Press Ctrl + A.
- Selecting a horizontal / vertical range of cells: select the 1st cell then press the Shift key down and click on the last cell of the desired range.
- Selecting cells at will: Click on the 1st cell then maintaining the Ctrl Key down click on any subsequent cell to add it to the selection.
- Selecting all rows and columns in a range: select the upper left cell in the range then press simultaneously on Shift + Ctrl + down arrow and then right arrow. If you do not want to select all columns, release the Ctrl key and press the right arrow once for every column you want to add to the selection.

Working with defined names

- Go to 'tools' sheet and select the cell that contains the VAT percentage.
- Define a name (VATpct f.ex.) in the name bar for that cell (no space or fancy characters, start with a letter)
- Navigate to another sheet and then select the name 'VATpct' in the name bar to be forwarded to that cell.
- In the VAT sheet, define the name 'NetPrices' over the column that contains the net price in the table and define the name 'quantities' for the array of cells containing all the quantities sold.
- Create a formula that computes the total quantities sold (=SUM(quantities))
- Same thing for the total net price for all sales (=SUM(NetPrice)).
- Compute on every row in a new column the total price with tax (=NetPrice * VATpct)

Working with sheets

- 1'048'576 lignes x 16'384 colonnes (A – XFD)
- Add a sheet / Delete a sheet.
- Change the background color of a sheet tab.
- Hide / Unhide a sheet.
- Copy a sheet.
- Move a sheet (organize your sheets list).
- Move a sheet to another / a new file.
- Use the sheets navigation menu.
- Inserting a background picture in a sheet (Page layout > Background)

Freeze the panes

- In the View menu, you can freeze a portion of the sheet so that you always keep this information visible while you navigate through the rest of the data. The frozen part will always be the rows above and the columns to the left of the selected cell at the time of blocking.
- You can also split the window to split your screen into 2 independent parts and thus view different areas of your sheet at the same time.

SORTING

- *Exercise file: data form.xlsx*

Sort a data block:

Click in a data column and then click **Home > Sort & Filter > Sort A to Z**

Also available under **Data > Sort**

Multi-level sorting:

When sorting, the same value may be repeated across many rows. We can then define a 2nd sort order within these blocks from the 1st sort.

Click a cell of the data you want to sort, and then click **Home > Sort and filter > Custom Sort**.

FILTERING

- *Exercise file: data form.xlsx*

Filter a table:

Click in a data column and click **Home > Sort and Filter > Filter** (CTRL+SHIFT+L).

This enables the filter and sort icons in each header cell in the table.

Click one of these icons to filter the rows in the table, e.g., select a few values from the NOCID column.

Then repeat the operation on the DisciplineID column. The filters are cumulative.

Test the text, numeric, and date filter options.

Since Office 365, there is an alternative with the FILTER function to easily get a copy of the filtered data without changing the display of the initial table.

Search, find & replace

- *Exercise file: data form.xlsx*

Search for a Value:

Look for the text 'OV' in the table. (Home > Search & Select > Find)

Search for 2025 in column E and replace with 2024. (Home > Search & Select > Replace)

Look for the blank cells in column I and replace with 'Not available'. (Home > Find and Select > Go to special > blanks)

Find cells that contain a formula. (Home > Find and Select > Formulas)

FORMULAS – Intro

- Exercise file: data form.xlsx

An Excel formula always starts with '='.

You can use Excel as a calculator: e.g. type '=2+2' in a cell.

You can use the contents of a cell in a formula. For example, type '= C5 + 1 ' in cell K5.

You can also use functions in formulas. Type '=SUM(A4:C4) ' in cell D4 and copy the formula through all the cells in column D up to row 18.

Add in column E the formula that calculates the amount of VAT knowing that the tax is 8%.

Same exercise (in column F) but using an external cell (of your choice) which contains the VAT rate in %.
